Exercise 7.3: PVC pipe is manufactured with a mean diameter of 2.565 cm and a standard deviation of 0.008 cm. Find the probability that a random sample of $n = 5$ sections of pipe will have a sample mean diameter greater than 2.560 cm and less than 2.570 cm.

Answer

Central Limit Theorem: $\bar{X} \approx N(\mu = 2.565, \sigma = 0.0027)$
0.9392

Exercise 7.7: The compressive strength of concrete is normally distributed with $\mu = 17\,237 \text{ kN/m}^2$ and $\sigma = 345 \text{ kN m}^{-2}$. Find the probability that a random sample of $n = 5$ specimens will have a sample mean diameter that falls in the interval $17\,230 \text{ kN m}^{-2}$ to $17\,305 \text{ kN m}^{-2}$.

Answer

$\bar{X} \sim N(\mu = 17237, \sigma = 154.2887)$
0.1884

Exercise 7.10: Suppose that the random variable X has the continuous uniform distribution

$$f(x) = \begin{cases} 1, & 0 \leq x \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

Suppose that a random sample of $n = 27$ observations is selected from this distribution. What is the approximate probability distribution of $\bar{X} + 1/2$? Find the mean and variance of this quantity.

Answer

Central Limit Theorem: $\bar{X} + \frac{1}{2} \approx N(\mu = 1, \sigma = \frac{1}{18})$

Exercise 7.11: Suppose that X has a discrete uniform distribution

$$f(x) = \begin{cases} 1/4, & x = 1, 2, 3, 4 \\ 0, & \text{otherwise} \end{cases}$$

A random sample of $n = 36$ is selected from this population. Find the probability that the sample mean is greater than 2.3 but less than 2.7, assuming that the sample mean would be measured to the nearest tenth.

Answer

$$X_{\text{sum}} \sim N(\mu = 90, \sigma = \sqrt{45})$$

Correction for continuity, without rounding to one decimal: $P(83 \leq X_{\text{sum}} \leq 97) = 0.7364$

Correction for continuity, rounded to one decimal: $P(85 \leq X_{\text{sum}} \leq 95) = 0.5877$

Exercise 7.12: The amount of time that a customer spends waiting at an airport check-in counter is a random variable with mean 8.2 min and standard deviation 6 min. Suppose that a random sample of $n = 36$ customers is observed. Find the probability that the average time waiting in line for these customers is

- (a) Less than 10 min
- (b) Between 5 min and 10 min
- (c) Less than 6 min

Answer

Central Limit Theorem: $\bar{X} \approx N(\mu = 8.2, \sigma = 1)$

(a) 0.9641

(b) 0.9634

(c) 0.0139

Exercise 7.13: A random sample of size $n_1 = 16$ is selected from a normal population with a mean of 75 and a standard deviation of 8. A second random sample of size $n_2 = 9$ is taken from another normal population with mean 70 and standard deviation 12. Let $\bar{X}_1$ and $\bar{X}_2$ be the two sample means. Find:

- (a) The probability that $\bar{X}_1 - \bar{X}_2$ exceeds 4
- (b) The probability that $2.5 \leq \bar{X}_1 - \bar{X}_2 \leq 5.5$

Answer

$$D = \bar{X}_1 - \bar{X}_2 \sim N(\mu = 5, \sigma = \sqrt{20})$$

(a) 0.5885

(b) 0.2564
