Exercise 4.11: The probability density function of the length of a metal rod is $f(x) = 2$ for $2.3 < x < 2.8$ meters.

- (a) If the specifications for this process are from 2.25 to 2.75 meters, what proportion of rods fail to meet the specifications?
- (b) Assume that the probability density function is $f(x) = 2$ for an interval of length 0.5 meters. Over what value should the density be centered to achieve the greatest proportion of rods within specifications?

Answer

- (a) 0.1
- (b) 2.5, thus $f(x) = 2$ for $2.25 < x < 2.75$

Exercise 4.13: Suppose that the cumulative distribution function of the random variable X

(b) 0.7

(c) 0

(d) 0

Exercise 4.15: Determine the cumulative distribution function given the following probability density function:

$$f(x) = 2e^{-2x} \quad \text{for } 0 < x$$

Answer

$$F(x) = \begin{cases} 0 & x \leq 0 \\ 1 - e^{-2x} & x \geq 0 \end{cases}$$

Exercise 4.21: Determine the cumulative distribution function for the following probability density function:

$$f(x) = \begin{cases} 2, & \text{for } 2.3 < x < 2.8 \\ 0, & \text{otherwise.} \end{cases}$$

Use the cumulative distribution function to determine the probability that a length exceeds 2.7 meters.

Answer

$$F(x) = \begin{cases} 0 & x \leq 2.3 \\ 2x - 4.6 & 2.3 \leq x \leq 2.8 \\ 1 & x \geq 2.8 \end{cases}$$
$$P(X > 2.7) = 0.2$$
